AB The invention provides an improved electrotransport drug delivery system for analgesic drugs, namely fentanyl and sufentanil. The fentanyl/sufentanil is provided as a water soluble salt (e.g., fentanyl hydrochloride), preferably in a hydrogel formulation, for use in an electrotransport device (10). In accordance with the present invention, a transdermal electrotransport delivered dose of fentanyl/sufentanil is provided which is sufficient to induce analgesia in (e.g., adult) human patients suffering from moderate-to-severe pain associated with major surgical procedures.

AB Compositions and methods for the therapy and diagnosis of cancer,
particularly pancreatic cancer, are disclosed. Illustrative
compositions comprise one or more pancreatic tumor polypeptides,
immunogenic portions thereof, polynucleotides that encode such
polypeptides, antigen presenting cell that expresses such
polypeptides, and T cells that are specific for cells expressing
such polypeptides. The disclosed compositions are useful, for
example, in the diagnosis, prevention and/or treatment of
diseases, particularly pancreatic cancer.

AB The present invention relates to pH-sensitive mucoadhesive film-forming gels and wax-film composites suitable for topical and mucosal delivery of molecules of interest, namely active pharmaceuticals. The gels comprise a pharmaceutically acceptable pH-sensitive polymer that responds to a lowering of pH by precipitating into films when in contact with the skin or mucosal surface. The films also comprise an adhesive polymer that allows the film to remain in contact with the tissue for an extended period of time. The wax-film composites comprise a bi-layer film having both the said pH-sensitive mucoadhesive layer to promote strong adherence to the skin and mucosal surfaces as well as a specially bonded wax layer intended to extend the adherence of the film to tissues for a prolonged period of time. The invention also relates to the use of said pH-sensitive film-forming gels and wax-film composites to deliver molecules of interest, such as

09/344693

small molecules, peptides, proteins, and nucleic acids either locally to act at the site of administration or for the absorption of said molecules of interest across biological membranes into the systemic circulation.

AB A veterinary **delivery** system in the form of a pliable
film comprising at least one **binder**, at least
one **lubricant**, at least one **solvent** for the
binder and **lubricant**, and an effective amount of
at least one effective agent. According to one embodiment, a
flavorant is included in a pliable hydrophilic **film** in
order to enhance **oral** acceptability by the
animal. In other embodiments, the **films**
preferably have a moisture content of about 2-15%, preferably
about 3-7% by weight. The hydrophilic **films** most
preferably have at least one effective agent distributed
homogeneously throughout the **film**.

Also disclosed are methods of delivering veterinary delivery
systems wherein a pliable, hydrophilic film comprising at least
one effective agent is placed within the oral cavity of an animal.

AB A method for treating the natural cane reed used in woodwind musical instruments. The method includes contacting at least the proximal portion of said reed with a polymer treatment liquid, in which the liquid delivers at least 1% by weight of polymer into the reed, based upon the percentage increase in dry weight of that portion of said reed contacted by the liquid. The reed remains substantially water-permeable, yet is rendered resistant to degradation by saliva. An impregnated reed is also described, in which at least the proximal portion of the reed has been impregnated by a liquid that includes a non-toxic polymeric material that is water-insoluble upon drying or curing within the reed. The impregnated portion of the reed is at least 25% as permeable to water as an identical portion of an equivalent untreated reed, yet is resistant to degradation by saliva.

AB The invention provides an improved electrotransport drug delivery system for analgesic drugs, namely fentanyl and sufentanil. The fentanyl/sufentanil is provided as a water soluble salt (e.g., fentanyl hydrochloride), preferably in a hydrogel formulation, for use in an electrotransport device (10). In accordance with the present invention, a transdermal electrotransport delivered dose of fentanyl/sufentanil is provided which is sufficient to induce analgesia in (e.g., adult) human patients suffering from moderate-to-severe pain associated with major surgical procedures.

AB A transdermal electrotransport drug delivery device having an anode, a cathode and a source of electrical power electrically connected to the anode and the cathode. The cathode includes a cathodic electrode and a cathodic reservoir comprised of a housing composed of a polymeric material and an aqueous medium in contact with the housing. The aqueous medium includes i) a drug or an electrolyte salt or a mixture thereof and ii) a cetylpyridinium salt in an amount sufficient to inhibit microbial growth in the aqueous medium. The polymeric material is compatible with the cetylpyridinium salt. A process is also provided wherein when electric current flows from the source of electrical power so that the drug is transdermally delivered to the patient by electrotransport from the anodic reservoir, the cetylpyridinium salt is not transdermally delivered to the patient by electrotransport from the cathodic reservoir. A process for preparing a transdermal electrotransport drug delivery device is also provided.

AB The invention provides an improved electrotransport drug delivery system for analgesic drugs, namely fentanyl and sufentanil. The fentanyl/sufentanil is provided as a water soluble salt (eg, fentanyl hydrochloride) dispersed in a hydrogel formulation for use in an electrotransport device (10). In accordance with one aspect of the invention, the concentration of fentanyl/sufentanil in the donor reservoir (26) solution is above a predetermined minimum concentration, whereby the transdermal electrotransport flux of fentanyl/sufentanil is maintained independent of the concentration of fentanyl/sufentanil in solution. In accordance with a second aspect of the present invention, the donor reservoir (26) of the electrotransport delivery device (10) is comprised of silver and the donor reservoir (26) contains a predetermined "excess" loading of fentanyl/sufentanil halide to prevent silver ion migration with attendant skin discoloration. In accordance with a third aspect of the present invention, a transdermal electrotransport delivered dose of fentanyl/sufentanil is provided which is sufficient to induce analgesia in (eg, adult) human patients suffering from moderate-to-severe pain associated with major surgical procedures.

AB Terpolymers which are sensitive to pH and temperature are useful carriers for conducting bioactive agents through the gastric juices of the stomach in protected form. Such terpolymers swell at the higher physiologic pH of the intestinal tract causing release of the bioactive agents into the intestine. The terpolymers are linear and are made up of 35 to 99 wt % of a temperature sensitive component, which imparts to the terpolymer LCST (lower critical solution temperature) properties below body temperatures, 1 to 30 wt % of a pH sensitive component having a pK.sub.a in the range of from 2 to 8 which functions through ionization or deionization of carboxylic acid groups to prevent the bioactive agent from being lost at low pH but allows bioactive agent release at physiological pH of about 7.4 and a hydrophobic component which stabilizes the LCST below body temperatures and compensates for bioactive agent effects on the terpolymers. Such terpolymers provide for safe bioactive agent loading, a simple procedure for dosage form fabrication and the terpolymer functions as a protective carrier in the acidic environment of the stomach and also protects the bioactive agents from digestive enzymes until the bioactive agent is released in the intestinal tract.

AB A dispensing system is disclosed comprising a wall surrounding a lumen. The lumen comprises (1) a thermo responsive composition comprising a beneficial agent, (2) means for occupying space in the lumen for pushing the thermo responsive composition from the dispensing system, and (3) means for enhancing the amount of the beneficial agent dispensed from the system positioned between the thermo responsive composition and the means for occupying space.

AN 2002095797 MEDLINE

TI The co-solvent Cremophor EL limits absorption of orally administered paclitaxel in cancer patients.

AU Malingre M M; Schellens J H; Van Tellingen O; Ouwehand M; Bardelmeijer H A; Rosing H; Koopman F J; Schot M E; Ten Bokkel Huinink W W; Beijnen J H

SO BRITISH JOURNAL OF CANCER, (2001 Nov 16) 85 (10) 1472-7.
Journal code: 0370635. ISSN: 0007-0920.

AB The purpose of this study was to investigate the effect of the co-solvents Cremophor EL and polysorbate 80 on the absorption of orally administered paclitaxel. 6 patients received in a randomized setting, one week apart oral paclitaxel 60 mg m⁽⁻²⁾ dissolved in polysorbate 80 or Cremophor EL. For 3 patients the amount of Cremophor EL was 5 ml m⁽⁻²⁾, for the other three 15 ml m⁽⁻²⁾. Prior to paclitaxel administration patients received 15 mg kg⁽⁻¹⁾ oral cyclosporin A to enhance the oral absorption of the drug. Paclitaxel formulated in polysorbate 80 resulted in a significant increase in the maximal concentration (C_{max}) and area under the concentration-time curve (AUC) of paclitaxel in comparison with the Cremophor EL formulations (P = 0.046 for both parameters). When formulated in Cremophor EL 15 ml m⁽⁻²⁾, paclitaxel C_{max} and AUC values were 0.10 +/- 0.06 microM and 1.29 +/- 0.99 microM h⁽⁻¹⁾, respectively, whereas these values were 0.31 +/- 0.06 microM and 2.61 +/- 1.54 microM h⁽⁻¹⁾, respectively, when formulated in polysorbate 80. Faecal data revealed a decrease in excretion of unchanged paclitaxel for the polysorbate 80 formulation compared to the Cremophor EL formulations. The amount of paclitaxel excreted in faeces was significantly correlated with the amount of Cremophor EL excreted in faeces (P = 0.019). When formulated in Cremophor EL 15 ml m⁽⁻²⁾, paclitaxel excretion in faeces was 38.8 +/- 13.0% of the administered dose, whereas this value was 18.3 +/- 15.5% for the polysorbate 80 formulation. The results show that the co-solvent Cremophor EL is an important factor limiting the absorption of orally administered paclitaxel from the intestinal lumen. They highlight the need for designing a better drug formulation in order to increase the usefulness of the oral route of paclitaxel

L48 ANSWER 2 OF 4 MEDLINE

AN 97402179 MEDLINE

TI Immunoreactivity for taurine in the cochlea: its abundance in supporting cells.

AU Horner K C; Arousseau C

SO HEARING RESEARCH, (1997 Jul) 109 (1-2) 135-42.
Journal code: 7900445. ISSN: 0378-5955.

AB Taurine is the second most abundant free amino acid in the brain where its osmoregulatory function is well established. Taurine-deprived kittens show retinal pathology leading to blindness. In the inner ear, taurine has been reported to be the most abundant free amino acid although its role in inner ear function is not known. Immunohistochemistry was employed here to investigate the localisation of taurine in normal cochleae of the guinea pig compared with two different conditions: experimentally

induced endolymphatic hydrops and after oral administration of glycerol. In normal cochleae, by light microscopy, taurine-like immunoreaction was never observed in the sensory outer hair cells and appeared absent from the inner hair cells. In contrast taurine-like immunolabeling was found to be present in all supporting tissue with the striking exception of the tectorial membrane and the outer pillar cell which had no or little taurine immunoreactivity respectively. In early experimental endolymphatic hydrops, the distribution of taurine-like immunoreactivity appeared similar to that observed for normal cochleae. In long-term hydrops, degenerated outer hair cells were replaced by the swelling of the phalangeal process of the Deiters' cells which became highly immunoreactive to taurine. After glycerol administration, the tectorial membrane became more tightly bound to the apical surface of the sensory hair cells and distinctly immunoreactive to taurine. The localisation of taurine in the organ of Corti shown here is consistent with taurine being involved in the maintenance of osmotic equilibrium in the normal and perhaps also in the restructuration of the pathological organ of Corti.

 AN 77087304 MEDLINE
 TI Acute toxicity of various solvents in the mouse and rat. LD50 of ethanol, diethylacetamide, dimethylformamide, dimethylsulfoxide, glycerine, N-methylpyrrolidone, polyethylene glycol 400, 1,2-propanediol and Tween 20.
 AU Bartsch W; Sponer G; Dietmann K; Fuchs G
 SO ARZNEIMITTEL-FORSCHUNG, (1976) 26 (8) 1581-3.
 Journal code: 0372660. ISSN: 0004-4172.
 AB The LD50's of various solvents frequently used in toxicological work to improve the solubility of otherwise poorly soluble compounds were determined in the mouse and rat. The substances investigated were ethanol, dimethylacetamide, dimethylformamide, dimethylsulfoxide, glycerine, N-methylpyrrolidone, polyethylene glycol 400, 1,2-propanediol and Tween 20. The substances were administered under standardized conditions to groups of 10 animals (5 females, 5 males) (mice and rats) at doses that supplied at least 3 values lying between the LD16 and LD84. The median lethal dose and slope were determined with the aid of Finney's programmed probit analysis. The results are tabulated as LD50 ml/kg with 95% confidence limits. It is recommended that when using these solvents for pharmacological and toxicological investigations not more than a quarter of the LD50 should be used because otherwise there will be confusion between the deaths due to the substance being investigated and those due to the solvent.

AB Disclosed is a veterinary delivery system in the form of a pliable **film** comprising binders, **lubricants**, **solvents** for the binders and **lubricants**, and an effective amt. of at least one effective agent. According to one embodiment, a flavorant is included in a pliable hydrophilic **film** in order to enhance **oral** acceptability by the animal. In other embodiments, the **films** preferably have a moisture content of 2-15 %, preferably 3-7 %. The hydrophilic **films** most preferably have at least one effective agent distributed homogeneously throughout the **film**. Also disclosed are methods of delivering veterinary delivery systems wherein a pliable, hydrophilic **film** comprising at least one effective agent is placed within the **oral** cavity of an animal.
